Abstract (Basic): JP 8053500 A

A fusion protein, prepared by introducing peptide(s) into at least one arbitrary position in a polypeptide chain of human serum albumin, is new. Also claimed are: (1) a gene (I) encoding the fusion protein; (2) a recombinant vector contg. (I); and (3) a host cell transformed with the vector of (2) and capable of producing the fusion protein.

USE - The gene is used for production of a fusion protein capable of demonstrating its physical activity sufficiently without destruction of the stereostructure of human serum albumin protein.

ADVANTAGE - A fusion protein eg. a fusion protein for inhibiting cancer metastasis, which could be prepared in the prior art only by a combination of a chemical synthetic method and a binding method, can be produced directly and efficiently for the first time by recombinant DNA technology, thus realising the stable supply in industrial scale processes of a fusion protein for inhibiting cancer metastasis as pharmaceuticals.
